

ATTENTION!

Proshop Owners and Ball Drillers

While drilling the JoPo Twist, you DO NOT need/want to sand or bevel the bowling ball, the outer (inside and outside diameter), or the inner (outside diameter). Doing so defeats the fit of the grip design, which may cause movement. You DO NOT need to sand or bevel anything but the fit of the bowler's thumb. The grip is designed so that the ball drillers do not need to do anything extra. Please view the images below to get a visual of what the TWIST should look like.

This is what the TWIST is intended to look like.

This shows when you sand or bevel the outer or the inner.
