

TRANSFORMING

THE GAME

THE FIRST EVER

The Transformer is built for bowlers who want versatility and innovation in one package. With its sophisticated Morph-Wing™ Core, we've created ball motion with precision.

INNOVATION SPARKS TRANSFORMATION

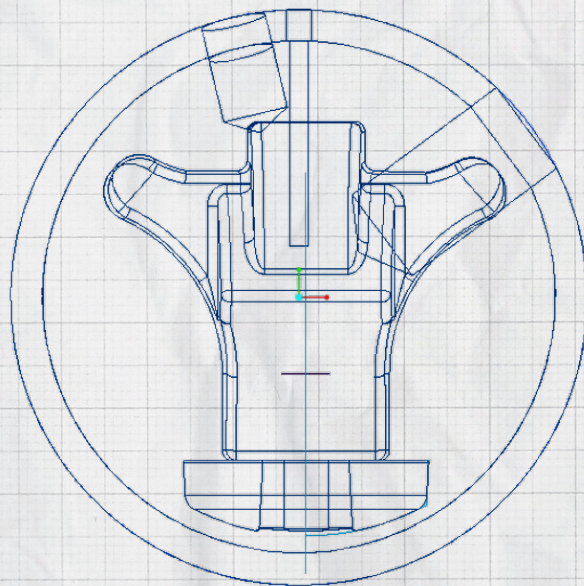

The Technology Advantage: Our precision-engineered core design gives you control over ball motion that others simply cannot match. By strategically placing or avoiding the precession wing during drilling, you get predictable, repeatable results tailored to your style and lane conditions.

PIN UP LAYOUT

For traditional thumb players, this drilling keeps your thumb hole away from the precession wing. As a result:

- Enhances torque-induced precession, helping the ball retain axis rotation.
- Creating a stronger backend motion and more entry angle.
- Best for: More open angles as lanes begin to transition.

PIN DOWN LAYOUT

For traditional thumb players, this drilling puts your thumb hole right through the precession wing. As a result:

- Inhibits torque-induced precession and enhances asymmetry/dynamics.
- An earlier, smoother hook and rounder shape downlane.
- Best for: Straighter angles and fresh oil conditions when you need control.

2-HANDED BOWLERS

Drilling options offers flexibility in shaping reaction:

Hitting the precession wing ($3\frac{1}{2}^{\circ}$ to $5\frac{1}{2}^{\circ}$ pin-to-POG):

- Earlier and smoother motion

Missing the precession wing (under $3\frac{1}{2}^{\circ}$ or over $5\frac{1}{2}^{\circ}$ pin-to-POG):

- Cleaner, more angular motion
